Reliable partner for your Game Development needs

Greater achievement by Offshore Game Development Company in Gaming Development Industries

A leading online casino game provider was looking to upgrade the web as well as desktop versions of their flagship casino product "Multiplayer Poker". The project requirement was to bring the existing poker web client nearer to the desktop version by adding numerous functionalities and implement drastic performance enhancement. An independent strategic business unit of NINtec (Offshore Game Development) gets greater achievement in Developing Multiplayer Poker Game and successful cater his client.

The client is among the top notch online casino game providers. They have a range of casino products, both as web based flash applications and C++ based desktop clients. One of their flagship casino products is multiplayer poker. It comprises all major poker game types and categories with real as well as practice money. The client has laid out concrete future plans to upgrade all of their casino products, both at web based and desktop level.

The flash based online poker client had not been upgraded since 2 years. Meanwhile, the counterpart desktop client had been upgraded multiple times during the same span. That had resulted in a major gap between 2 versions and the user base was constantly demanding parity between both versions, in terms of available functionalities. Moreover, the existing flash client was written in ActionScript 2.0, which was slow in terms of game play performance. The project requirement was to bring the existing poker client nearer to the desktop version by adding numerous functionalities and implement drastic performance enhancement.

Looking at the project requirement, the entire application was migrated to ActionScript 3.0 to leverage the robust and highly improved ActionScript Virtual Machine (AVM) 2 contrary to the legacy AVM 1. One of the major components of the application has been migrated to Adobe Flex for rich user interface and ease of styling. The event model was completely changed to reduce latency in backend communication as well as within the application.
